

CEVAHİR
PERLİTE

Introduction

Cevahir Holding has been a well- established and prominent name in the construction sector both nationally and internationally for over 50 years.

Over the years it has been expanded and grown in areas such as tourism, hotels, security and healthy & safety.

Cevahir Perlite is yet another off shoot carrying the company name into another fast- growing and exciting sector.

Our main functions are; ore extraction, crushing & screening, and expansion. We aim to provide fast, friendly and efficient service backed by a product of consistent and reliable quality.

Furthermore for the purpose of testing our product we also have on location a fully functional expansion plant, which has even been used to cater to orders both in Turkey and internationally.

Quarry

Located in the Yuntdag province of Izmir Turkey, it is expected that our open quarries could hold up to 25 million tonnes of perlite reserves.

All of this is sourced in our only active quarry near the village of Tavukcukuru, this means we can, in confidence, provide a perlite ore of consistent quality so our customers can rest assured that our products will never let them down.

Crushing & Screening Plant

Our crushing and screening facility, which is located directly beside our mine has an annual capacity of over 140,000 tonnes.

The plant is fully automated and made up of the latest technology and machinery.

We are able to crush and screen according to any size specified by customer demand that are different than our existing 7 standard products.

Expansion Plant & Quality Control

For the main purpose of testing and understanding our products, we have made a sizeable investment in our own expansion plant, which is regularly expanding the crushed and screened perlite ore produced from our facility.

We wouldn't sell something we wouldn't use ourselves, therefore we are constantly using the expanded perlite that we produce in our parent company's construction sites, both in Turkey and abroad.

Further to testing our products in our expansion plant, our on-site laboratory works tirelessly to regularly test and analyse perlite from our quarry, Crushing & Screening plant, and of course expanded perlite from our expansion plant.
